

Amtrak Takes Delivery of New Maintenance Facility

During the winter of 2006, Rubb Buildings worked with Nason Construction and Amtrak's designers to develop a temporary vehicle repair facility. The structure, measuring 130' (39.63m) x 180' (54.88m) with 21' (6.4m) sidewalls, is located in Wilmington, Delaware. This facility can service up to 12 rail engines at one time and the structure is erected over four existing railroad tracks for easy entrance and exit.

The Rubb organization, with production facilities in the United States, Great Britain, and Norway, is recognized as a world leader in the design, development, and manufacture of relocatable structures.
