

PRESS RELEASE

North Country Union High School's New Storage Building

North Country Union High School of Newport, Vermont recently took delivery of their 40' x 100' BVE Range Rubb Building to use for storage. Rubb's BVE building design provided the school with a rigid structure that would stand up to the heavy snow and windloads associated with Vermont winters. Rubb, Inc. worked with the school's general contractor, Spates Construction, to successfully design and install this structure.

The Rubb organization, with production facilities in the United States, Great Britain, and Norway, is recognized as a world leader in the design, development, and manufacture of relocatable structures.
